

# READY-MIX CONCRETE

## ENVIRONMENTAL PRODUCT DECLARATION

**BOMBAY - 40MPA 13MM TREMIE MARCH CON LOW CARBON**

**Managed By:** Holcim NZ Ltd  
**EPD Process Certificate No.:** 1016  
**Verified Accreditation Body:** Epsten Group, Inc.  
**EPD Registration No:** EPD-IES-0021336

**Publication Date:** 2025-04-02  
**Version Date:** 2025-04-02 **Valid Until:** 2030-04-02  
**Revision Number:** 1.0  
**Geographical Scope:** New Zealand

In accordance with ISO 14025:2016  
and EN15804+A2:2019/AC:2021  
**Programme Operator:**  
EPD International AB  
**Regional Programme:**  
EPD Australasia Limited

An EPD should provide current information and may be updated if conditions change. The stated validity is therefore subject to the continued registration and publication at [www.environdec.com](http://www.environdec.com).

# INTRODUCTION

Worldwide, there is a growing expectation for Governments and organizations to increase transparency and disclosure regarding environmental impacts, particularly greenhouse gas (GHG) emissions. This trend has gained momentum since the landmark COP 21 Paris Agreement in 2015, where nations collectively committed to ambitious efforts to combat climate change.

Simultaneously, the global demand for construction materials is on the rise due to population growth and increased urbanization. Concrete, the world's second most utilized commodity after water, significantly contributes to the embodied GHG emissions of infrastructure and property assets. In light of Aotearoa's commitment to achieving net zero by 2050, Holcim New Zealand is actively working towards a lower carbon footprint in the built environment.

For Holcim, building progress entails offering a comprehensive range of low carbon, high-performance, and specialty concrete solutions tailored for Aotearoa's homes, buildings, and infrastructure. We provide guidance, tools, and resources to empower you to confidently specify your projects. Our commitment extends to delivering solutions that align with your needs consistently.

This underscores the urgent need for construction materials both now and in the future, emphasizing the construction materials industry's pivotal role in addressing climate change. At Holcim, we acknowledge our responsibility to contribute to global emissions reduction targets. To guide our efforts, we have developed a roadmap outlining specific actions to align with these objectives.

**Together, we can build better  
to help decarbonise Aotearoa.**

# ABOUT HOLCIM NEW ZEALAND

## BUILDING PROGRESS

Holcim New Zealand (NZ) is a leading solutions provider for your design and construction needs in New Zealand, dating back to 1888. Today, we supply essential construction materials from cement terminals & depots, quarries and ready-mix concrete sites to customers. Our ready-mix concrete solutions offer a comprehensive range of low carbon, high-performance, and specialty concrete solutions tailored for Aotearoa's homes, buildings, and infrastructure throughout the country.

Globally, Holcim is 60,000 people around the world who are passionate about building progress for people and the planet through four business segments: Cement, Ready-Mix Concrete, Aggregates and Solutions & Products.

Sustainability is at the core of our global strategy, with our industry's first 2030 and 2050 net-zero targets validated by the Science Based Targets initiative for all scopes. We are leading the transition towards low-carbon construction and driving a circular economy by providing materials and solutions that are re-shaping the way our industry builds. Holcim NZ has developed a range of low carbon solutions specifically for the New Zealand market.

This EPD provides our stakeholders with confidence about the environmental impact of our products.

# HOLCIM NZ READY-MIX CONCRETE

Holcim NZ is committed to delivering project-specific Environmental Product Declarations (EPDs) on demand, a significant stride in our sustainability journey. This approach reflects our comprehensive commitment to integrating sustainability throughout our organization and operations. Utilizing third-party verified data, our concrete solutions empower us to collaborate seamlessly with customers, optimizing sustainability performance from tender to design and construction.

Our concrete products from Holcim NZ come with the assurance of an EPD Process Certification. This certification signifies our ability to produce compliant EPDs in-house, providing substantial capability and flexibility in leveraging life cycle impact data for our operations and customer collaborations.

Obtaining our EPD Process Certification involved a strategic investment in integrating Life Cycle Assessment (LCA) into our systems and processes. We underwent a rigorous third-party evaluation adhering to relevant ISO standards and guidelines set by the International EPD Programme and EPD Australasia. This ensures the credibility and reliability of the data supporting our commitment to sustainability.

This EPD has been developed using our EPD Process Certification for 40MPa 13mm Tremie March Con Low carbon with production occurring at Bombay Plant.

# LCA INFORMATION

## Declared Unit

The declared unit adopted is 1m<sup>3</sup> of ready-mix concrete in use.

## Time Representativeness

The plant data for the LCA is based on 2022 calendar year production data. The mix data for the LCA is based on 2025 calendar year production data.

## Databases and LCA Software Used

The software used was SimaPro® LCA software (v9.6). The inventory data for the processes are entered in the LCA software and linked to the pre-existing background data for upstream feedstocks and services. Inventory data was selected per the standards, in the following order of preference:

- Ecoinvent 3.10 database was used as the primary source for inventory data (Ecoinvent v3.10, 2023). At the time of this report, this Ecoinvent database version is less than 2 years old.
- The Australian Life Cycle Inventory (AusLCI) v1.42 was compiled by the Australian Life Cycle Assessment Society (ALCAS) – this data will comply with the AusLCI Data Guidelines (Australian Life Cycle Inventory Database Initiative (AusLCI), 2023). At the time of this report, this AusLCI database version is around 2 years old.
- The Environmental Footprint (EF) database v3.1 is facilitated by the European Commission and developed by Ecoinvent, Sphera, Blonk, CEPE, and Pré Sustainability (Developer Environmental Footprint (EF), 2022). At the time of this report, this EF database version is around 2 years old.

The following impact categories were calculated manually for the foreground data:

- Use of renewable primary energy resources used as raw materials (PERM)
- Use of non-renewable primary energy resources used as raw materials (PENRM)
- Materials for recycling
- Non-hazardous waste disposed

## Data quality

Foreground data on raw material requirements, manufacture and distribution was provided as primary source by Holcim (NZ) for the year January 2022 – December 2022. Schemes for data quality assessment of generic and specific data from EN 15804+A2 are used to perform this data quality assessment activity.

## Upstream processes

The upstream processes include those involved in Module A1 – raw material supply. This module includes:

- Extraction, transport, and manufacturing of raw materials.
- Generation of electricity from primary and secondary energy resources, also including their extraction, refining and transport for Modules A1 and A3.

Generic data from LCA databases were used to model all raw materials for ready-mix concrete, such as cement, additives, admixtures, aggregates and sand, water, fly ash and slag. The cellulose pulp is assumed to have 12.2 MJ/kg as renewable energy resource used as raw material, based on the energy density quoted for biomass municipal and industrial materials in the National Greenhouse Accounts Factors (Department of the Environment, 2021). A few exceptions apply where suppliers of raw materials publish product specific EPDs, which are incorporated in the background processes to better reflect the environmental impacts associated with these raw materials in processes (e.g., extraction, transportation, manufacturing) before arriving at Holcim (NZ) production plants.

## Core processes

The core processes include those involved in Module A2 and Module A3 – upstream raw material transport and manufacturing. They include:

- External transportation of materials to the core processes and internal transport.
- Manufacturing of concrete.
- Transportation of materials for recycling and landfilling externally
- Treatment of waste and wastewater generated from the manufacturing processes.

All the materials used for producing ready-mix concretes were transported via truck. Specifically, aggregates and cements were assumed to be transported by heavy trucks and other raw materials were assumed to be transported by medium trucks.

Concrete manufacturing is undertaken at Holcim (NZ) branded concrete batching plants. All plants have the same or similar site resource use profile, management systems and operating systems. The process of manufacturing concrete involves the careful proportioning and mixing of cement, supplementary cementitious materials (SCMs), aggregates, water, chemical admixtures and additives including colour oxides in some instances. These raw materials are mixed in batching plants according to the specific concrete mix designs.

Site specific manufacturing data was collected during fiscal year 2022. These include inputs like energy (e.g., electricity, fuels, etc.) and outputs (e.g., waste to landfill, recyclables, etc.). They are allocated to 1m<sup>3</sup> of ready-mix concrete product based on the annual production volume in each batching plant. Electricity is modelled based on the

electricity grid mix from New Zealand Ministry of Business, Innovation & Employment.

Electricity for the manufacturing site is modelled based on the electricity mix published by the Ministry of Business, Innovation and Employment, with primary source from hydro (60%), geothermal (18%), wind (6.5%), gas (9.9%), and coal (2.88%). The electricity emission (GWP-GHG) is 0.0742 kg CO<sub>2e</sub>/kWh.

### Downstream processes

This includes deconstruction (Module C).

Deconstruction (C1) is assumed to use drilling to break and remove the concrete. The distance for waste collecting from construction site (C2) to landfill plant is assumed 50km. All products are assumed to be landfilled (C4) and there is no carbonation at the end of life. It's assumed that there is no recycling for the product at the end of life, so the C3 impact is 0.

No CO<sub>2</sub> uptake has taken place in any module declared.

### Allocation

According to EN 15804+A2, in a process step where more than one type of product is generated, it is necessary to allocate the environmental stressors (inputs and outputs) from the process to the different products (functional outputs) in order to get product-based inventory data instead of process-based data. An allocation problem also occurs for multi-input processes. In an allocation procedure, the sum of the allocated inputs and outputs to the products shall be equal to the unallocated inputs and outputs of the unit process.

The following stepwise allocation principles shall be applied for multi-input/output allocations:

- The initial allocation step includes dividing up the system sub-processes and collecting the input and output data related to these sub-processes.
- The first (preferably) allocation procedure step for each sub-process is to partition the inputs and outputs of the system into their different products in a way that reflects the underlying physical relationships between them.
- The second (worst case) allocation procedure step is needed when physical relationship alone cannot be established or used as the basis for allocation. In this case, the remaining environmental inputs and outputs from a sub-process must be allocated between the products in a way that reflects other relationships between them, such as the economic value of the products.

Holcim (NZ) produces a range of concrete mixes at each of their concrete batching plants, with the range dependent on customer demand. Due to the random nature of which mixes are produced and the large number of concrete mixes, allocation was required to determine the amount of site resource use, discharges and emissions associated with each mix. Annual consumption of energy and resource were collected at each site. Allocation was carried out based on physical relationships - annual production amount, by volume in m<sup>3</sup>. It's assumed that all kinds of ready-mix concrete products consume the same amount of resource and energy during production.

One exception is the fuel consumption for mixing and loading in manufacturing plants. Holcim (NZ) performed a

fuel burn diagnostic report on a typical mixing truck they owned. The fuel consumption for mixing and loading or loading only (for some plants) for 1 m<sup>3</sup> product was diagnosed, calculated, and directly used without any allocation since it's measured per declared unit covered in this EPD.

### Cut-off Rules

It is common practice in LCA/LCI protocols to propose exclusion limits for inputs and outputs that fall below a threshold % of the total, but with the exception that where the input/output has a "significant" impact it should be included. According to the PCR 2019:14, life cycle inventory data shall according to EN 15804+A2 include a minimum of 95% of total inflows (mass and energy) per module. It should also include a minimum of 99% of renewable and non-renewable primary energy use as well as the total mass input of that unit process. Inflows not included in the LCA shall be documented in the EPD. Data gaps in included stages in the downstream modules shall be reported in the EPD, including an evaluation of their significance. In accordance with the PCR 2019:14, the following system boundaries are applied to manufacturing equipment and employees:

- Environmental impact from infrastructure, construction, production equipment, and tools that are not directly consumed in the production process are not accounted for in the LCI. Capital equipment and buildings typically account for less than a few percent of nearly all LCIs and this is usually smaller than the error in the inventory data itself. For this project, it is assumed that capital equipment makes a negligible contribution to the impacts as per Frischknecht et al. with no further investigation (Frischknecht, 2007).
- Personnel-related impacts, such as transportation to and from work, are also not accounted for in the LCI. The impacts of employees are also excluded from inventory impacts on the basis that if they were not employed for this production or service function, they would be employed for another. It is very hard to decide what proportion of the impacts from their whole lives should count towards their employment. For this project, the impacts of employees are excluded.

Based on this guidance, no energy or mass flows, except packaging of materials were excluded. All materials required for manufacturing are delivered via trucks and ships without packaging.

### Comparability

EPDs within the same product category but registered in different EPD programmes, or not compliant with EN 15804, may not be comparable. For further information about comparability, see EN 15804 and ISO 14025.

## Key Assumptions

| Module | Assumption or limitation                                                       | Impact on LCA results | Discussion                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|--------------------------------------------------------------------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A1     | Raw material packaging                                                         | Minor                 | For simplicity and lacking comprehensive data, all raw material packaging is excluded in this study.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| A1     | Most emission factors assigned to raw materials are generic                    | Significant           | The emission factors assigned to most raw materials covered in this calculator are generic that are available in the LCA databases. They are the closest proxy based on the available raw material information. If more specific impacts available from suppliers in the future, they should replace the current ones to better reflect the impacts of the raw material.                                                                                                                                                                                                                                                                                    |
| A2     | Transport distance from raw material supplier to Holcim (NZ) production plants | Minor                 | Although transport distances are available for some raw materials, others that don't have the data are estimated and assumed to be the average distance of the corresponding material type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| A2     | GreenStar and IS indicators for Holcim cement                                  | Minor                 | This process EPD includes the GreenStar and IS indicators for their future use in reporting on these two platforms. However, the transport impacts in Holcim's published EPD for its cement product doesn't include these indicators. Thus, in the background calculation of these indicators, the tool uses the generic transport LCA background in Ecoinvent v3.10 (heavy truck) and made assumptions that transport from Holcim terminal Auckland to depot is 200km (truck transport only), and transport from terminal Timaru to depot is 50km (truck transport only). Based on these assumptions, the tool calculated the GreenStar and IS indicators. |
| A3     | Waste production                                                               | Minor                 | The amount of waste and wastewater produced are estimated by Holcim (NZ). If more specific data is available in the future, it could improve accuracy of the impacts for 1m <sup>3</sup> of product.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| C1     | Deconstruction                                                                 | Minor                 | The deconstruction process is assumed to be the same for all products.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| C2     | Transport to landfill                                                          | Minor                 | It is assumed 50km distance to landfill based on the distance from likely construction sites within major cities to main landfill sites for the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Data Quality

Foreground data on raw material requirements, manufacture and distribution was provided as primary source by Holcim (NZ) for the year January 2022 – December 2022. Schemes for data quality assessment of generic and specific data from EN 15804+A2 are used to perform this data quality assessment activity, as shown in table 2.

| Module | Life Cycle Stage                      | Collected Foreground Data                                                          | Data Source and Year                                                                              | Data Quality                            |
|--------|---------------------------------------|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|-----------------------------------------|
| A1     | Raw material                          | Raw material types and characterizations                                           | Supplied by Holcim (NZ), 2022                                                                     | Primary source data, very good          |
| A2     | Raw material transport from suppliers | Location of material suppliers<br>Transport mode, truck information, and distances | Supplied by Holcim (NZ), 2022                                                                     | Primary and secondary source data, good |
| A3     | Manufacturing                         | Energy and water inputs<br>Estimated waste outputs.<br>Annual production volumes   | Supplied by Holcim (NZ), 2022                                                                     | Primary source data, good               |
| C1     | Deconstruction and demolition         | Inputs for deconstruction & demolition                                             | Assumptions for deconstruction energy                                                             | Secondary source data, fair             |
| C2     | Transport to waste processing         | Distance to end-of-life destination                                                | General assumption                                                                                | Secondary source data, fair             |
| C4     | Disposal                              | End of life destination                                                            | Waste to landfill rate based on New Zealand national GHG report from Ministry for the Environment | Secondary source data, fair             |

**Table 2. Data Quality Assessment**

SYSTEM BOUNDARY

The system boundary is shown in Figure 1 below. The scope of LCA for this EPD is cradle-to-gate with modules C1-C4, and module D. Emissions from construction installation (A5) was excluded as Holcim (NZ) does not have operational control over the installation of products at the construction site. In addition, the following life cycle stages were also excluded: distribution (A4) and use stages (B1-B7).

All modules included in this EPD are marked as X and those excluded are marked as ‘Not declared’ (ND) Table 3.

# EPD PRODUCT DESCRIPTION AND USE

## Product Description

Ready-mix concrete is produced at batching plants where controlled operations allow precise mix designs resulting in a product that is delivered to construction sites in a freshly mixed, plastic, or unhardened state.

Concretes categorised as Normal and Special are defined and made in accordance with NZS 3104:2003, to ensure that nominal strengths and performance requirements are achieved.

| Product Name                           | Strength | Plant  | Mix Code | Description of Use                      |
|----------------------------------------|----------|--------|----------|-----------------------------------------|
| 40MPa 13mm Tremie March Con Low carbon | 40MPa    | Bombay | 401TMCL  | Ready Mix and precast concrete products |

**Table 4. Concrete covered by this EPD**

## Content Declaration

The following table provides a summary of the materials included in Holcim ready-mix concrete and their relative composition by weight.

| Item                                 | Hazardous Content | Mass (%) |
|--------------------------------------|-------------------|----------|
| Portland Cement                      | ✓                 | 5-25%    |
| Aggregate                            |                   | 60-90%   |
| Supplementary Cementitious materials | ✓                 | 0-12%    |
| Water                                |                   | 5-12%    |
| Admixture                            | ✓                 | 0-1%     |

**Table 5. Material Composition**

The product does not contain one or more substances that are listed in the “Candidate List of Substances of Very High Concern for Authorisation”.

## Manufacturing process and flow diagram

**Figure 2. Manufacturing Process Flow**

## Packaging

Holcim ready-mix concrete is delivered in bulk with no packaging.

## Recycled Material

BS EN 16757:2017 specifically lists the following materials relevant to the study as co-products:

- Fly ash;
- Ground granulated blast furnace slag; and
- Silica Fume.

As such, the above materials are considered as co-products of their production process and the impacts for their production process are allocated according to PCR 2019:14 Construction Products and Construction Services (co-produced goods, multi-output allocation).

There is no recycled materials used in producing the product.

# ENVIRONMENTAL PERFORMANCE

The potential environmental impacts, use of resources and waste categories included in this EPD were calculated using the SimaPro v9.6 tool and are listed in the table below. All tables from this point will contain abbreviations only. The potential environmental performance is calculated based on the input data and the emission factors from Ecoinvent v3.10. The LCA results are relative expressions and do not predict impacts on category endpoints, the exceeding of thresholds and safety margins or risks.

Long-term storage (>100 years) is not taken into consideration in the impact estimate.

| Impact Category                                                                                                         | Abbreviation     | Measurement                             | Assessment Method & Implementation                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------|------------------|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Potential Environmental Impacts</b>                                                                                  |                  |                                         |                                                                                                                                                                                                               |
| Global warming potential (fossil)                                                                                       | GWP-fossil       | kg CO <sub>2</sub> equivalents (GWP100) | Baseline model of 100 years of the IPCC based on IPCC 2013                                                                                                                                                    |

<sup>5</sup> Calculated as sum of *Bulk waste* and *Slags/ash*.

<sup>6</sup> Calculated as sum of *Bulk waste* and *Slags/ash*.

<sup>7</sup> Calculated as sum of *Bulk waste* and *Slags/ash*.

<sup>8</sup> This indicator accounts for all greenhouse gases except biogenic carbon dioxide uptake and emissions and biogenic carbon stored in the product. As such, the indicator is identical to GWP-total except that the CF for biogenic CO<sub>2</sub> is set to zero; calculated as the sum of *GWP-luluc* and *GWP-fossil* in the LCA model.

\* Disclaimer 1 – The results of this environmental impact indicator shall be used with care as the uncertainties on these results are high or as there is limited experience with the indicator.

\*\* Disclaimer 2 – This impact category deals mainly with the eventual impact of low dose ionizing radiation on human health of the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents, occupational exposure nor due to radioactive waste disposal in underground facilities. Potential ionizing radiation from the soil, from radon and from some construction materials is also not measured by this indicator.

## Life cycle impact, measurement, and methods for Green Star and IS Rating

| Impact Indicators                          | Measurement Unit                     | Assessment Method and Implementation |
